

Note on Transverse Collimator Positions

1 Alignment Baseline

The collimators which have a single beam inside (all collimators installed in 2006/2007) are aligned to the collimated beam.

2 Transverse Collimator Positions

The transverse coordinates of the collimators in the transition regions are summarised in table 2. In these transition regions the half distance of the two beam lines decreases from 0.097 m to 0.00 m (both beams in same beam pipe) in the experimental insertions or increases from 0.097 m to 0.112 m in warm section of IR3 and IR7. The values are extracted from the *LHC* optics version 6.501 using the corresponding *MADX* sequence. The used scripts are shown in section 5.

Name	x_{start} [mm]	x_{center} [mm]	x_{end} [mm]
TCTVA.4R1.B2	-82.548	-83.384	-84.219
TCTH.4R1.B2	-84.445	-85.280	-86.115
TCTH.4L2.B1	85.613	84.479	83.345
TCTH.4R2.B2	83.345	84.479	85.613

Table 1: Transverse collimator positions, x-coordinate is given at the beginning, the middle and the end of the vacuum tank. The coordinates are given in the reference frame of beam 1 (to be confirmed), see figure 1

3 Reference Frame

The definition of reference frame used by the simulation tools (*MADX and Six-Track*) is shown in figure 1. Beam 1 goes clockwise and beam 2 counter-clockwise. The positive x-axis for beam 1 points from the ring outside, whereas for beam 2 is points inside. The azimuthal angle defining the rotation of an element (collimator) starts from the positive x-axis and is measured clockwise in the x-y plane.

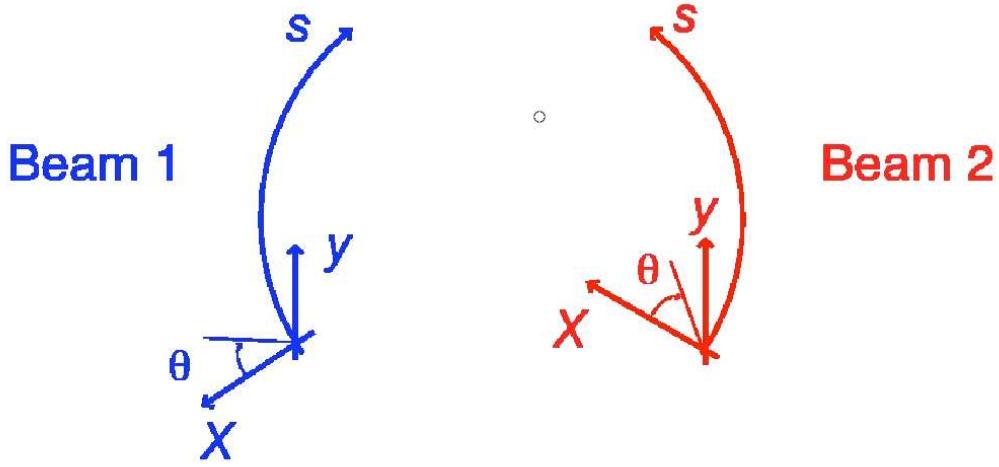

Figure 1: Definition of the reference frames used by the simulation tools (*MADX and Six-Track*)

4 Issues

Passive absorbers and scrapers are excluded from the table 2 (they are phase 2 anyway). These are:

TCDD.4l2	TCHSH.6L3.B1	TCLAP.6L3.B1	TCLAP6R3.B2
TCHSH.6R3.B2	TCHSV.6L7.B1	TCHSH.6L7.B1	TCLAP.6L7.B1
TCLAQ.6L7.B1	TCLAQ.6R7.B2	TCLAP.6R7.B2	TCHSH.6R7.B2
TCSHV.6R7.B2			

Table 2: Passive absorbers and scrapers (*phase 2*) in transition regions, which are not considered in table 2
